## Pain Points Summary (mapped to AS-IS stages)

| ID    | Pain Points                                                                | AS-IS Stage           | Impact                                                                     |
|-------|----------------------------------------------------------------------------|-----------------------|----------------------------------------------------------------------------|
| PP-01 | Manual resume screening against JD, no automated ranking                   | Screen resumes        | 4-5 days lost/ requisition; recruiter time consumed across 15-20 open reqs |
| PP-02 | Interviews scheduling coordinated via email/phone across 2-3 panel members | Schedule Interview    | 6-8 days lost/ requisition; largest single contributor to delay            |
| PP-03 | No SLA defined at any funnel stage                                         | All stages            | Delays identified reactively only when hiring manager escalates            |
| PP-04 | Feedback collected informally with no fixed deadline                       | Feedback              | 3–5 days lost; stalls offer decision                                       |
| PP-05 | No centralized system of record; status lives in personal spreadsheets     | All stages            | No visibility for hiring managers or leadership; duplicated effort         |
| PP-06 | Candidates receive no status updates during the process                    | Shortlist - Interview | Drives approx 30% candidate drop-off as candidates accept competing offers |

---

## Root Cause Analysis - Top 2 Pain Points

### PP-01: Manual Resume Screening (4–5 days/requisition)

#### 5Whys:

1. **Why** does screening take 4-5 days? - Recruiter manually reads 100+ resumes per requisition against JD.
2. **Why** is it manual? - No ATS or automated ranking tool exists to pre-filter or score candidates
3. **Why** was this never automated? - Recruitment technology investment was never prioritized, hiring volume grew faster than process maturity.

4. **Why** wasn't volume growth flagged earlier? - No SLA or time-to-hire tracking existed to surface the bottleneck proactively.
5. **Why** was there no SLA tracking? - Recruitment operated informally, with no defined funnel-stage ownership or metrics. **Root cause: absence of a structured, metrics-driven recruitment process.**

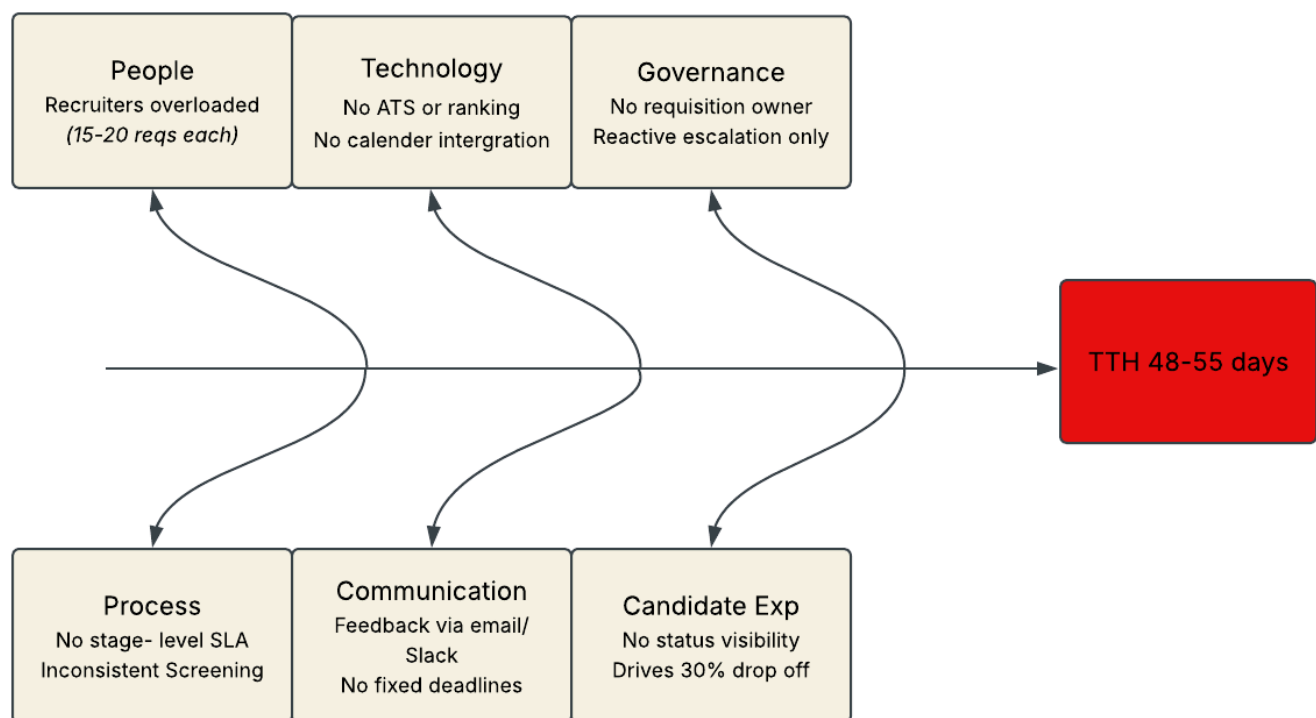

## PP-02: Manual Interview Scheduling (6–8 days/requisition)

### 5 Whys:

1. **Why** does scheduling take 6–8 days? - Coordination happens via email/phone across recruiter, candidate, and 2–3 panel members
2. **Why** does this take so long? - No shared calendar visibility; each round of availability-checking is sequential, not parallel.
3. **Why** is there no shared calendar tool? - No scheduling automation was ever integrated with the panel's Outlook calendars/ Gmail calendars.
4. **Why** wasn't this integrated? - Recruitment systems and HRIS/calendar systems were never connected via API.
5. **Why** were systems never connected? - No prior business case existed to justify the integration investment. **Root cause: recruitment technology stack was never modernized alongside hiring volume growth.**

---

## Fishbone (Ishikawa) Diagram

## **Root Cause Summary**

The two root causes; absence of a structured, metrics-driven process (PP-01) and an unmodernized, disconnected technology stack (PP-02) - together account for 10–13 of the 48–55 total days in the funnel. Both are directly resolved by the TO-BE automation approach: ATS-based screening addresses the process/technology gap in PP-01, and calendar-integrated scheduling addresses the same in PP-02.
