

Defect ID	Description	Severity	Priority	Linked TC	Status	Resolution Notes
DEF- 01	Scheduling engine proposes only 2 conflict-free slots instead of the required 3 when multiple valid slots exist; traced to a hardcoded display limit in the slot-rendering component.	Low	Medium	TC-07	Resolved	Display limit corrected from 2 to 3; retested and passed on second cycle.
DEF-02	Panel member calendar invites are sent approx 40 minutes after slot confirmation instead of immediately, due to a delay in the notification queue processing job.	Medium	Medium	TC-09	Resolved	Notification job trigger moved from batch (15-min interval) to event-driven; retested and passed.
DEF-03	Candidate status notification includes the internal match score value in the message payload, exposing ranking detail that should remain internal-only per BR-11/FR-18.	Critical	Ceritical	TC-18	Resolved	Root cause: notification template pulled the full candidate object instead of a filtered status-only field set. Template corrected to exclude score/ranking fields entirely; added a field-level filter check before any candidate-facing notification is sent. Retested and passed. Flagged to Compliance for awareness given the PII/data-exposure nature of the defect.
DEF-04	PII retention batch job correctly flags candidate records eligible for purge at the 12-month mark, but the purge/anonymization step does not execute; job scheduled on a weekly cycle instead of the required daily check, causing eligible records to remain unpurged for up to 6 additional days.	Medium	High	TC-21	Resolved	Batch job schedule corrected from weekly to daily; added a monitoring alert if the job fails to run as scheduled. Retested and passed.
