## Smart Recruitment: Funnel Optimization for Time-to-Hire Reduction

**Prepared for:** NovaTech Solutions | **Prepared By:** Carol Felix, Business Analyst

---

### Problem Statement

NovaTech Solutions, a fictional mid-size IT services company with approx. 4,500 employees, hires over 200 technology professionals per quarter across Java, Data Analyst, Business Analyst, and QA roles. Recruitment is handled through manual resume screening and manual interview scheduling, with no automated ranking or funnel-stage tracking in place.

---

### What Manual Process Is Costing Today

- Average time-to-hire is 48–55 days, against an industry benchmark of 25–30 days for similar roles.
  - Approx 30% of shortlisted candidates drop out of the funnel before interview, largely due to slow response times and competing offers.
  - Recruiters manage 15–20 open requisitions each, with no SLA tracking to flag stalled requisitions proactively.
- 

### Proposed Solution

Design and implement Smart Recruitment, a funnel automation solution that introduces ATS-based resume screening and ranking, automated interview scheduling, and real-time funnel-stage visibility for recruiters and hiring managers.

---

### Expected Benefit

- Reduce average time-to-hire from 48–55 days to under 30 days by removing manual screening and scheduling bottlenecks.
  - Cut candidate drop-off between shortlist and interview from 30% to under 15%, by accelerating response times.
  - Increase requisitions handled per recruiter by approx 30%, by removing manual screening effort.
- 

### Recommendation

Approve funding to design and build the Smart Recruitment funnel automation solution, piloted on bulk technical hiring (Java, Data Analyst, QA roles) before extending to specialist hiring. Bulk

technical roles provide the highest requisition volume and most standardized screening criteria, allowing the time-to-hire and drop-off improvements to be validated quickly and with lower risk before scaling to lower-volume, more specialized hiring. Without this investment, NovaTech will continue to rely on manual screening and coordination that scales poorly with hiring volume, increasing both time-to-hire and the risk of losing qualified candidates to competing offers.
